I personally contributed majorly to the front end, planning, architecture, and database development. I was able to greatly strengthen my skills in user experience, how to develop reusable code, and database calls and management. Our project greatly helped me develop my programming and software engineering skills that I will be able to use in a postgraduate position.

I learned how to more effectively communicate my ideas and how to translate them into a real project. Next, being able to read, merge, and manage several features into a single repository. How to deal with merge conditions and reading my teammates code. I had some issues when dealing with the web-socketing and was able to rely on my teammates to explain how it worked. I was able to find success with the user experience of the application and developing backend systems.

Our group was able to develop a web application for user to compete and learn using their favorite programming languages. This includes an execution engine, test cases on submit, web-socketing to connect users, and how to structure an enjoyable user experience. Using several git and GitHub features enabled us to work effectively and more easily communicate with each other. This includes branch management, team meetings, and peer lead topics. We found that we could get sidetracked easily so meeting online sometimes wouldn't be as efficient.

I believe that I was able to contribute my fair share and want to give a special kudos to both of my teammates. Henock who was able to develop the execution engine backend to run the programming languages. The execution engine works perfectly and is containerized to enable us to run the application on any device. On the other hand, Rukudzo was able to set up the 1v1 and 2v2 aspects of the application which was a major feature for us to be able to show off at the demo.
